## Chemistry 1100 Practice Exam 1

Show all of your work and reasoning to receive credit. Include units as well. You may not share calculators.

1. A 24.4 L volume of ethane gas is heated from $19^{\circ} \mathrm{C}$ to $122^{\circ} \mathrm{C}$ at constant pressure. What is the final volume of the gas?
2. A sample of nitrogen gas kept in a container of volume 0.24 L and at a temperature of $12^{\circ} \mathrm{C}$ exerts a pressure of 11.2 atm . Calculate the number of moles of gas present.
3. A gas at 450 mm Hg and $14^{\circ} \mathrm{C}$ occupies a volume of 2.85 L . Calculate its volume at STP.

## 4. A 2.10 L vessel contains 4.44 g of a gas at 1.00 atm and $27.0^{\circ} \mathrm{C}$. Calculate the density of the gas in grams per liter. Then calculate the molar mass of the gas.

5. Consider the formation of nitrogen dioxide from nitric oxide and oxygen:
$2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NO}_{2}(\mathrm{~g})$
If 4.5 L of NO are reacted with excess $\mathrm{O}_{2}$ at STP , what is the volume in liters of the $\mathrm{NO}_{2}$ produced?
6. The first step in the industrial recovery of zinc from the zinc sulfide ore is roasting, that is, conversion of ZnS to ZnO by heating:
$2 \mathrm{ZnS}(\mathrm{s})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{ZnO}(\mathrm{s})+2 \mathrm{SO}_{2}(\mathrm{~g}) \Delta \mathrm{H}=-879 \mathrm{~kJ}$
Calculate the heat released (in kJ ) per gram of ZnS roasted.
7. A 4.25 kg piece of gold metal is heated from $15.5^{\circ} \mathrm{C}$ to $197.0^{\circ} \mathrm{C}$. Calculate the heat absorbed (in kJ and $\mathrm{kJ} / \mathrm{mol}$ ) by the metal.
8. A quantity of 2.5000 g of methanol $\left(\mathrm{CH}_{3} \mathrm{OH}\right)$ was burned in a constant volume bomb calorimeter. Consequently, the temperature of the water rose by $2.40^{\circ} \mathrm{C}$. If the heat capacity of the bomb plus water was $10.4 \mathrm{~kJ} /{ }^{\circ} \quad \mathrm{C}$, calculate the molar heat of combustion of methanol.
9. Calculate the heat of decomposition for the process below at constant pressure
and $25^{\circ} \mathrm{C}: \mathrm{CaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{CaO}(\mathrm{s})+\mathrm{CO}_{2}(\mathrm{~g})$
Use the standard enthalpy of formation data given at the end of the exam.
10. Calculate the standard enthalpy change for the reaction:
$2 \mathrm{Fe}(\mathrm{s})+\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{Al}(\mathrm{s})+\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})$
given that:

$$
\begin{array}{ll}
\mathrm{Al}_{2} \mathrm{O}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{Al}(\mathrm{~s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) & \Delta \mathrm{H}=+1670 \mathrm{~kJ} \\
\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{Fe}(\mathrm{~s})+3 / 2 \mathrm{O}_{2}(\mathrm{~g}) & \Delta \mathrm{H}=+822 \mathrm{~kJ}
\end{array}
$$
