CHEM1100 Practice Exam 2

You have 120 minutes to complete this exam. Answer all questions. To receive credit you must show your reasoning and all calculations in the bluebook. Report numerical answers with the correct number of significant figures and with correct units. No speaking is allowed during the exam. You must use the calculator you have. Once you complete the exam you may leave the room. Each question is valued at 5 points for a total of 100 points.

Toom. Each question is valued at 5 points for a total of 100 points.				
1. How many protons, electrons, and neutrons are in an atom of the isotope 63Cu?				
2. Write the chemical formula for the compound formed from Cr3+ and SO42- ions.				
3. Name the following compounds: PbO Li2SO3 Cl2O7				
4. The atomic masses of the two stable isotopes of boron are 10B (19.78% abundance and mass = 10.0129 amu) and 11B (80.22% abundance and mass = 11.0093 amu). Calculate the average atomic mass of boron.				
5. How many moles of magnesium (Mg) are there in 87.3 g of Mg?				
6. Calculate the number of atoms in 0.551 g of potassium (K).				

7. What is the molar mass of sucrose (C12H22O11)?				
8. Calculate the moles of chloroform (CHCl3) in 198 g of chloroform.				
9. Calculate the percentage mass composition of each element in ammonia (NH3).				
10. A compound containing boron and hydrogen contains 6.444 g of boron and 1.803 g of hydrogen. The molar mass of the compound is about 28 g/mol. What is (a) the empirical formula of the compound and (b) the molecular formula of the compound?				
11. Write and balance the following equation using the smallest whole numbers possible: Solid iron (Fe) reacts with oxygen gas (O2) to form solid iron (III) oxide (Fe2O3).				
12. Consider the following chemical reaction: 2CH3OH + 3O2 → 2CO2 + 4H2O If 4.5 mol of methanol (CH3OH) react with excess oxygen (O2) how many moles of water (H2O) are produced?				
13. Consider the following chemical reaction: 2NO + O2 → 2NO2 If 1.25 moles of nitric oxide (NO) react with 0.55 moles of oxygen (O2) how many moles of NO2 are produced?				

EXAM 1 REFERENCE MATERIALS SOLUBILITY RULES

- 1. Salts containing Group I elements are soluble (Li+, Na+, K+, Cs+, Rb+). Exceptions to this rule are rare. Salts containing the ammonium ion (NH4+) are also soluble.
- 2. Salts containing nitrate ion (NO3-) are generally soluble.
- 3. Salts containing Cl-, Br-, I- are generally soluble. Important exceptions to this rule are halide salts of Ag+, Pb2+, and (Hg2)2+.
- 4. Most silver salts are insoluble. AgNO3 and Ag(C2H3O2) are common soluble salts of silver; virtually anything else is insoluble.
- 5. Most sulfate salts are soluble. Important exceptions to this rule include BaSO4, PbSO4, Ag2SO4 and SrSO4 .
- 6. Most hydroxide salts are only slightly soluble. Hydroxide salts of Group II elements (Ca, Sr, and Ba) are slightly soluble.
- 7. Most sulfides of transition metals are highly insoluble.
- 8. Carbonates are frequently insoluble.
- 9. Chromates are frequently insoluble.
- 10. Phosphates are frequently insoluble.
- 11. Fluorides are frequently insoluble.

POLYATOMIC IONS	NO2-	ammonium	NH4+
nitrite			
nitrate	NO3-	hydronium	H3O+
hydrogen phosphate	HPO42-	perchlorate	ClO4-
phosphate	PO43-	chlorate	ClO3-
chromate	CrO42-	chlorite	ClO2-
dichromate	Cr2O72-	hypochlorite	ClO-
cyanide	CN-	permanganat	MnO4-
		e	
hydroxide	OH-	carbonate	CO32-
sulfate	SO42-	hydrogen	HCO3-
		carbonate	
sulfite	SO32-	mercury (I)	Hg22+
